Hatvani, László (H-SZEG-B); Stachó, László (H-SZEG-B)
On small solutions of second order differential equations with random coefficients. (English summary)
Equadiff 9 (Brno, 1997).

Summary: “We consider the equation $x'' + a^2(t)x = 0$, $a(t) := a_k$ if $t_{k-1} \leq t < t_k$, for $k = 1, 2, \ldots$, where $\{a_k\}$ is a given increasing sequence of positive numbers, and $\{t_k\}$ is chosen at random so that $\{t_k - t_{k-1}\}$ are totally independent random variables uniformly distributed on the interval $[0, 1]$. We determine the probability of the event that all solutions of the equation tend to zero as $t \to \infty$.”
