Enumeration of trees: Formulas of Cayley and Kirchoff

Peter Hajnal, MSc - Discrete Mathematics

Bolyai Instite, University of Szeged, Hungary

2023 Fall

The Idea

Consider two sets

```
\{(T, a, z) : T \text{ is a tree on the vertex set } [n], \text{ and } a, z \in [n]\}
```

and

 $\{f:[n]\to [n]\}.$

э

The Idea

Consider two sets

 $\{(T, a, z) : T \text{ is a tree on the vertex set } [n], \text{ and } a, z \in [n]\}$

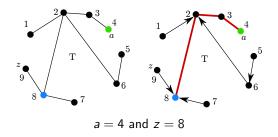

and

$$\{f:[n]\to [n]\}.$$

We are going to give a bijection between the two sets.

Joyal's proof of Cayley Theorem

An example

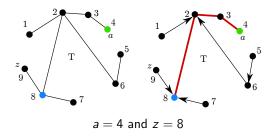

The Joyal coding of the example is as follows:

< 同 > < 回 > < 回 >

Joyal's proof of Cayley Theorem

An example

The Joyal coding of the example is as follows:

(1) Take the unique *a*-*z* path in the tree (*P*). List the vertices of the path in two different ways. First, use the increasing order (in our example 2 3 4 8). Second, use the order as you walk from *a* to *z* (in our example 4 3 2 8).

Joyal's proof of Cayley Theorem

Trees and linear algebra

An example (cont'd)

Peter Hajnal, MSc – Discrete Mathematics Enumeration of trees, University of Szeged, 2023

Joyal's proof of Cayley Theorem

An example (cont'd)

Write down the two sequences in two lines and interpret it as a $\varphi: V(P) \rightarrow V(P)$ permutation.

$$\begin{pmatrix} 2 & 3 & 4 & 8 \\ 4 & 3 & 2 & 8 \end{pmatrix}$$

Decoding

For decoding we are given an arbitrary $f : [n] \rightarrow [n]$. We must prove that there exists exactly one (T, a, z) triplet such that the above coding procedure assigns f to it.

▲□ ▶ ▲ □ ▶ ▲ □ ▶ ...

Decoding

For decoding we are given an arbitrary $f : [n] \rightarrow [n]$. We must prove that there exists exactly one (T, a, z) triplet such that the above coding procedure assigns f to it.

First, take the directed graph of f. I.e. \overrightarrow{G}_f the directed graph on V = [n], such that it has n edges: $\overrightarrow{if(i)}$ (i = 1, 2, ..., n). This a directed graph with the property that each node has out-degree 1.

For decoding we are given an arbitrary $f : [n] \rightarrow [n]$. We must prove that there exists exactly one (T, a, z) triplet such that the above coding procedure assigns f to it.

First, take the directed graph of f. I.e., \overrightarrow{G}_f the directed graph on V = [n], such that it has n edges: $\overrightarrow{if(i)}$ (i = 1, 2, ..., n). This a directed graph with the property that each node has out-degree 1.

Consider the sequence of sets:

 $V, f(V), f(f(V)), f(f(f(V))), \ldots$

This sequence will 'converge' to a set U.

The main lemma: Submatrices of size $(n-1) \times (n-1)$

Trees and linear algebra

向下 イヨト イヨト

The main lemma: Submatrices of size $(n-1) \times (n-1)$

Lemma

Let G be a graph, \overrightarrow{G} an arbitrary orientation of it, and r an arbitrary root. Let F be an edge set of size |V| - 1 (i.e. $Inc_{\overrightarrow{G}}^{-r}[F]$ is an $(n-1) \times (n-1)$ matrix).

The main lemma: Submatrices of size $(n-1) \times (n-1)$

Lemma

Let G be a graph, \vec{G} an arbitrary orientation of it, and r an arbitrary root. Let F be an edge set of size |V| - 1 (i.e. $Inc_{\vec{G}}^{-r}[F]$ is an $(n-1) \times (n-1)$ matrix).

Then the following properties are equivalent:

- (1) $Inc_{\overrightarrow{G}}^{-r}[F]$ has full rank (n-1), i.e. its rows are independent, also its columns are independent,
- (2) F doesn't contain an edge set of a cycle,
- (3) F is an edge set of spanning tree,
- (4) det $Inc_{\overrightarrow{G}}^{-r}[F] \in \{\pm 1\}.$

The Theorem of Kirchoff

Corollary (Theorem of Kirchoff)

Let (G, r) be an arbitrary rooted graph, and let \overrightarrow{G} be and arbitrary orientation of G. Then the number of spanning tree of G is

$$\det[\operatorname{Inc}_{\overrightarrow{G}}^{-r} \cdot (\operatorname{Inc}_{\overrightarrow{G}}^{-r})^{T}].$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・

Apply the Binet-Cauchy formula for $A = B = Inc_{\overrightarrow{G}}^{-r}$:

Apply the Binet-Cauchy formula for $A = B = Inc_{\overrightarrow{G}}^{-r}$:

$$\det[\operatorname{Inc}_{\overrightarrow{G}}^{-r} \cdot (\operatorname{Inc}_{\overrightarrow{G}}^{-r})^{T}] = \sum_{F \subset E(G) \atop |F| = |V| - 1} \operatorname{Inc}_{\overrightarrow{G}}^{-r}[F] \cdot \operatorname{Inc}_{\overrightarrow{G}}^{-r}[F].$$

Apply the Binet-Cauchy formula for $A = B = Inc_{\overline{G}}^{-r}$:

$$\det[\operatorname{Inc}_{\overrightarrow{G}}^{-r} \cdot (\operatorname{Inc}_{\overrightarrow{G}}^{-r})^{T}] = \sum_{\substack{F \subset E(G) \\ |F| = |V| - 1}} \operatorname{Inc}_{\overrightarrow{G}}^{-r}[F] \cdot \operatorname{Inc}_{\overrightarrow{G}}^{-r}[F]$$

By our Lemma these determinants are 0, or $(-1)^2$, or $(+1)^2$. If we ignore the 0 terms then we obtain

$$(D_G)_{v,v}=d(v).$$

 $A_G \in \mathbb{R}^{V \times V}$, the adjacency matrix of G, a loopless graph is a symmetric matrix:

 $(A_G)_{u,v} = \sharp$ of edges between u and v.

 $L_G = D_G - A_G$ is the Laplace matrix of G.

Laplace matrix of a graph

Definitions

 $D_G \in \mathbb{R}^{V \times V}$ is a diagonal matrix with the degrees on the diagonal:

$$(D_G)_{v,v}=d(v).$$

 $A_G \in \mathbb{R}^{V \times V}$, the adjacency matrix of G, a loopless graph is a symmetric matrix:

 $(A_G)_{u,v} = \sharp$ of edges between u and v.

 $L_G = D_G - A_G$ is the Laplace matrix of G.

Observation

$$A_{\overrightarrow{G}}^{-r}(A_{\overrightarrow{G}}^{-r})^{T} = L_{G}^{-r}$$

The Theorem of Kirchoff, the second form

The Theorem of Kirchoff, the second form

The number of spanning trees of a graph G is

$$\det L_G^{-r} = \det(D_G^{-r} - A_G^{-r}).$$
