Definition

Grid, neighbourhood relation

Definition

We call a rectangle/triangle an *island*, if for the cell t , if we denote its height by a_t , then for each cell $\hat{t}$ neighbouring with a cell of the rectangle/triangle T , the inequality $a_{\hat{t}} < \min\{a_t : t \in T\}$ holds.

Coding theory

Lemma 1 (G. Czédli). Let $\mathcal{C}$ be the set of cells. Let $\mathcal{I}$ be a subset of $P(\mathcal{C})$. Then the following two conditions are equivalent:

- (i) There exists mapping $A : \mathcal{C} \rightarrow \mathbb{R}$, $c \mapsto a_c$ such that $\mathcal{I} = \mathcal{I}_{\text{rect/tri}}(A)$.
- (ii) $\mathcal{C} \in \mathcal{I}$, and for any $l_1, l_2 \in \mathcal{I}$ either $l_1 \subseteq l_2$, or $l_2 \subseteq l_1$, or l_1 and l_2 are far from each other.

Subsets of $\mathcal{I}$ satisfying the equivalent conditions of Lemma 1 will be called *systems of rectangular/triangular islands*.

Characterization of systems of islands without heights

Lemma 1 (G. Czédli). Let $\mathcal{C}$ be the set of cells. Let $\mathcal{I}$ be a subset of $P(\mathcal{C})$. Then the following two conditions are equivalent:

- (i) There exists mapping $A : \mathcal{C} \rightarrow \mathbb{R}$, $c \mapsto a_c$ such that $\mathcal{I} = \mathcal{I}_{\text{rect/tri}}(A)$.
- (ii) $\mathcal{C} \in \mathcal{I}$, and for any $l_1, l_2 \in \mathcal{I}$ either $l_1 \subseteq l_2$, or $l_2 \subseteq l_1$, or l_1 and l_2 are far from each other.

Subsets of $\mathcal{I}$ satisfying the equivalent conditions of Lemma 1 will be called *systems of rectangular/triangular islands*.

LATTICE THEORETICAL METHOD

G. Czédli, A. P. Huhn and E. T. Schmidt: Weakly independent subsets in lattices, *Algebra Universalis* 20 (1985), 194-196.

Any two weak bases of a finite distributive lattice have the same number of elements.

LATTICE THEORETICAL METHOD

Any two weak bases of a finite distributive lattice have the same number of elements.

GRAPH THEORETICAL METHOD

$T_0(I)$

GRAPH THEORETICAL METHOD

GRAPH THEORETICAL METHOD

Lemma 2 (folklore)

- (i) Let T be a binary tree with ℓ leaves. Then the number of vertices of T depends only on ℓ , moreover $|V| = 2\ell - 1$.
- (ii) Let T be a rooted tree such that any non-leaf node has at least 2 sons. Let ℓ be the number of leaves in T . Then $|V| \leq 2\ell - 1$.

We have $4s + 2d \leq (n+1)(m+1)$.

The number of leaves of $T(\mathcal{I})$ is $\ell = s + d$. Hence by Lemma 2 the number of islands is

$$|V| - d \leq (2\ell - 1) - d = 2s + d - 1 \leq \frac{1}{2}(n+1)(m+1) - 1.$$

.

ELEMENTARY METHOD

We define

$$\mu(R) = \mu(u, v) := (u + 1)(v + 1).$$

Now

$$\begin{aligned} f(m, n) &= 1 + \sum_{R \in \max \mathcal{I}} f(R) = 1 + \sum_{R \in \max \mathcal{I}} \left(\left\lceil \frac{(u+1)(v+1)}{2} \right\rceil - 1 \right) \\ &= 1 + \sum_{R \in \max \mathcal{I}} \left(\left\lceil \frac{\mu(u, v)}{2} \right\rceil - 1 \right) \leq 1 - |\max \mathcal{I}| + \left\lceil \frac{\mu(C)}{2} \right\rceil. \end{aligned}$$

If $|\max \mathcal{I}| \geq 2$, then the proof is ready. Case $|\max \mathcal{I}| = 1$ is an easy exercise.

ELEMENTARY METHOD

We define

$$\mu(R) = \mu(u, v) := (u + 1)(v + 1).$$

Now

$$\begin{aligned} f(m, n) &= 1 + \sum_{R \in \max \mathcal{I}} f(R) = 1 + \sum_{R \in \max \mathcal{I}} \left(\left\lceil \frac{(u+1)(v+1)}{2} \right\rceil - 1 \right) \\ &= 1 + \sum_{R \in \max \mathcal{I}} \left(\left\lceil \frac{\mu(u, v)}{2} \right\rceil - 1 \right) \leq 1 - |\max \mathcal{I}| + \left\lceil \frac{\mu(C)}{2} \right\rceil. \end{aligned}$$

If $|\max \mathcal{I}| \geq 2$, then the proof is ready. Case $|\max \mathcal{I}| = 1$ is an easy exercise.

If $|\max \mathcal{I}| \geq 2$, then the proof is ready. Case $|\max \mathcal{I}| = 1$ is an easy exercise.

Examples / Exact results

Peninsulas (semi islands) (J. Barát, P. Hajnal, E.K. Horváth):

$$p(m, n) = f(m, n) = \lfloor (mn + m + n - 1)/2 \rfloor.$$

Cylindric board, rectangular islands (J. Barát, P. Hajnal, E.K. Horváth):

$$\text{If } n \geq 2, \text{ then } h_1(m, n) = \lfloor \frac{(m+1)n}{2} \rfloor.$$

Cylindric board, cylindric and rectangular islands (J. Barát, P. Hajnal, E.K. Horváth):

$$\text{If } n \geq 2, \text{ then } h_2(m, n) = \lfloor \frac{(m+1)n}{2} \rfloor + \lfloor \frac{(m-1)}{2} \rfloor.$$

Torus board, rectangular islands (J. Barát, P. Hajnal, E.K. Horváth):

$$\text{If } m, n \geq 2, \text{ then } t(m, n) = \lfloor \frac{mn}{2} \rfloor.$$

Examples / Exact results

Peninsulas (semi islands) (J. Barát, P. Hajnal, E.K. Horváth):

$$p(m, n) = f(m, n) = \lfloor (mn + m + n - 1)/2 \rfloor.$$

$$\text{If } m, n \geq 2, \text{ then } t(m, n) = \lfloor \frac{mn}{2} \rfloor.$$

Examples / Exact results

Changing the neighbourhood relation of cells (J. Barát, P. Hajnal, E.K. Horváth): $f^*(m, n) = f(m, n) = \lfloor (mn + m + n - 1)/2 \rfloor$.

Examples / Exact results

Changing the neighbourhood relation of cells (J. Barát, P. Hajnal, E.K. Horváth): $f^*(m, n) = f(m, n) = [(mn + m + n - 1)/2]$.

Examples / Square islands and Mersenne numbers

Square islands (E.K. Horváth, Z. Németh):

$\frac{2}{11}n^2 + n + \frac{2}{3} \leq f(n) \leq \frac{n^2+2n}{3}$. If n is a Mersenne number, i. e. $n = 2^k - 1$ for some $k \in \mathbb{N}$, then $f(n) = \frac{n^2+2n}{3}$.

Examples / Square islands and Mersenne numbers

$$f(2k+2) \geq f(k+1) + 3f(k) + 1; \quad f(2k+1) \geq 4f(k) + 1;$$

or in unified form:

$$f(n) \geq f\left[\frac{n}{2}\right] + 3f\left[\frac{n-1}{2}\right] + 1.$$

Examples / Square islands and Mersenne numbers

If n is a Mersenne number, i. e. $n = 2^k - 1$ for some $k \in \mathbb{N}$, then $f(n) = \frac{n^2 + 2n}{3}$.

Globe

Horváth - Németh conjecture

$$n + 1 = 2^{\kappa_1} + 2^{\kappa_2} + \dots + 2^{\kappa_k}, \quad \kappa_1 > \kappa_2 > \dots \kappa_k \geq 0.$$

Globe

Horváth - Németh conjecture

$$n + 1 = 2^{\kappa_1} + 2^{\kappa_2} + \dots + 2^{\kappa_k}, \quad \kappa_1 > \kappa_2 > \dots > \kappa_k \geq 0.$$
